How To Feed Another 2 Billion People By 2050

The Developing World's Agriculture Challenge

In a world in which the population is forecast to grow by 2 billion people by 2050, with the demand for food expected to double in that time, innovative technological developments will be key in being able to help farmers grow their businesses enough to feed the world.

The challenge will be compounded further as climate change puts even more pressure on resources, requiring

farmers to adapt to harshening conditions and make use of technological innovations in order to survive.

The greatest demand for food will come from developing countries, which will see almost all of the forecast population growth and many areas of which are also expected to be hard hit by climate change.
